

IS THIS A BAIT STATION?

That is the most common question we hear at **Sewer Assassin**. The short answer is **yes**, this is simply a bait station. The main difference between it and all the other bait stations available is it targets rodents where no other control measures can, in the **plumbing** itself.

Why does it matter?

If you or your company offers rodent control in urban settings, you must never discount plumbing as a possible entry point. You may have encountered this already, or did not know it was happening. If the home or business was constructed before 1983 it was plumbed using cast iron pipes. Cast iron is deteriorating at an alarming rate all over the US. This deterioration is allowing rodents to come up from the sewer and exploit these gaps to gain entry. In some cases, they emerge in toilets. This has been reported for decades all over the country. A simple online search can verify all these unsettling facts. Other contributing factors include rodents chewing through modern ABS pipes, improperly installed plumbing, and home renovations.

Figure 2: Rat coming out of deteriorated pipe

That makes sense, but is it hard to use?

On the contrary, in fact it's quite easy. If you use traditional exterior bait stations, then you can easily implement the **Sewer Assassin**. Simply find any existing 3" or 4" clean out, remove the existing cap, and replace it with this device. It then turns that access point into a working **rodent bait station**. You can now prove, monitor, and control rodents gaining entry to homes and businesses from plumbing.

PMP'S NO LONGER HAVE TO SAY THE WORDS; I THINK YOU SHOULD CALL A PLUMBER!

It's that simple! The best part is you now have a valuable new service to provide that generates new consistent **revenue** for your **Pest Control Business**.

ONLY USE RODENTICIDES LABELED FOR SEWER USE
